

p_slides

dead simple way to create semantic, nice to look at slides

- forget about styling, only think about content
 - *write markdown inline in html* (uses [showdown.js](#))
 - *slides are automatically styled nicely* (uses [twitter bootstrap](#))
 - *code samples are syntactically highlighted* (uses [jquery syntax](#))
 - *generates nice slides in the browser* (uses [slidy.js](#))
 - use arrow keys to navigate
 - use the generated 'table of contents' for quick navigation
 - supports printing to pdf

usage

- edit presentation.html to create your content
 - *use regular [markdown syntax](#)*
 - *create page breaks using '---'*
- open presentation.html in your favourite browser (tested in chrome/safari)
- if need be, print the document to pdf
 - *slides will automatically get separated into pages*
 - *styling will keep intact*

syntax highlighting

- write your code in <pre> tags
- annotate the given language using a css class

```
<pre class="syntax c">
static int foo;
void bar(void) {
    foo = 0;
    while (foo != 255) ; }
</pre>
```

1.	static int foo;
2.	void bar(void) {
3.	foo = 0;
4.	while (foo != 255) ; }
